NeuroXNet CT Severity Annotation Protocol — SOURCE REQUIRED

This is a release placeholder, not the study-specific annotation protocol. Replace it with the approved protocol actually used by the two neuroradiologists, including operational definitions for normal, mild, moderate, and severe hydrocephalus; Evans' index measurement procedure and thresholds; temporal-horn and periventricular criteria; reader blinding; adjudication procedure; and handling of indeterminate studies.

Do not cite this placeholder as evidence of the original annotation procedure. The original signed/approved protocol and source annotation records are required to substantiate the manuscript.
